

Dan Journic's First draft of Project code

This is the beginning of my code for the Phase 1 Project. The assignment is: Microsoft wants in on the streaming movie market and has asked me to analyze movie data to see what their best course of action would be. So the plan is to import a number of dataframes regarding movie budgets, ticket sales, ratings, etc. I then need to ask and answer 3 questions:

1. What movies make the most money?
2. What movies lost the most money?
3. What Microsoft properties are best suited to become movies?

So here goes. Start by importing all the necessary libraries:

```
In [1]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sb
from bs4 import BeautifulSoup as bsoup
import requests
%matplotlib inline
#!pip install Lxml
#!pip install html5lib
```

Now let's read some csv files:

```
In [78]: gross=pd.read_csv('bom.movie_gross.csv.gz')
imdb_rat=pd.read_csv('imdb.title.ratings.csv.gz')
rot_tom=pd.read_csv('rt.movie_info.tsv.gz', delimiter = '\t')
budgets=pd.read_csv('tn.movie_budgets.csv.gz')
tmdb=pd.read_csv('tmdb.movies.csv.gz')
```

So let's take a look at them:

```
In [3]: gross.head()
```

Out[3]:

Most of these files don't have the data I'm really looking for. In fact, some of them don't really have much useable data at all. But the budgets and gross dataframes do, so let's work with them for a bit. The next step I want to take is to turn the date released into an actual date, and turn the dollar amounts into numbers I can use.

Working with the data....

In [8]: budgets['release_date'] = pd.to_datetime(budgets['release_date'])

In [9]: budgets['production_budget'] = budgets['production_budget'].replace('[\\$,]', '', regex=True).astype(float)
 budgets['domestic_gross'] = budgets['domestic_gross'].replace('[\\$,]', '', regex=True).astype(float)
 budgets['worldwide_gross'] = budgets['worldwide_gross'].replace('[\\$,]', '', regex=True).astype(float)

In [10]: budgets.head()

Out[10]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross
0	1	2009-12-18	Avatar	4250000000.0	760507625.0	2.776345e+09

4	5	2017-12-15	Star Wars Ep. VIII: The Last Jedi	3170000000.0	620181382.0	1.316722e+09

Those numbers are pretty big, so I'm going to divide them by 1 million, to make them more manageable.

```
In [11]: budgets[budgets.columns[3:]] = budgets[budgets.columns[3:]].apply(lambda x: x/1000000)
```

And now let's see what the biggest domestic grossing movie is:

```
In [12]: budgets.sort_values(by=['domestic_gross'], ascending=False).head(10)
```

Out[12]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross

74	75	2008-07-18	The Dark Knight	185.0	533.720947	1001.996207

And now for worldwide gross:

In [13]: `budgets.sort_values(by=['worldwide_gross'], ascending=False).head(10)`

Out[13]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross
0	1	2009-12-18	Avatar	425.0	760.507625	2776.345279

6	7	2018-04-27	Avengers: Infinity War	300.0	678.815482	2048.134200
33	34	2015-06-12	Jurassic World	215.0	652.270625	1648.854864
66	67	2015-04-03	Furious 7	190.0	353.007020	1518.722794
26	27	2012-05-04	The Avengers	225.0	623.279547	1517.935897
3	4	2015-05-01	Avengers: Age of Ultron	330.6	459.005868	1403.013963
41	42	2018-02-16	Black Panther	200.0	700.059566	1348.258224
260	61	2011-07-15	Harry Potter and the Deathly Hallows: Part II	125.0	381.193157	1341.693157

So let's make a new column: 'world_net', that will be the worldwide gross subtracting the production budget.

In [14]: `budgets['world_net']=budgets['worldwide_gross'] - budgets['production_budget']`

In [15]: budgets.head(10)

Out[15]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross	world_net
0	1	2009-12-18	Avatar	425.0	760.507625	2776.345279	2351.3452

6	7	2018-04-27	Avengers: Infinity War	300.0	678.815482	2048.134200	1748.1342
7	8	2007-05-24	Pirates of the Caribbean: At Worldâ„¢s End	300.0	309.420425	963.420425	663.4204
8	9	2017-11-17	Justice League	300.0	229.024295	655.945209	355.9452
9	10	2015-11-06	Spectre	300.0	200.074175	879.620923	579.6209

So we'll create a new dataframe, 'budgets_wn', which is the budgets dataframe sorted by world net.

In [16]: budgets_wn=budgets.sort_values(by=['world_net'],ascending=False)

In [17]: budgets_wn.head(10)

Out[17]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross	world_ne
0	1	2009-12-18	Avatar	425.0	760.507625	2776.345279	2351.345
42	43	1997-12-19	Titanic	200.0	659.363944	2208.208395	2008.208

33	34	2015-06-12	Jurassic World	215.0	652.270625	1648.854864	1433.854
66	67	2015-04-03	Furious 7	190.0	353.007020	1518.722794	1328.722
26	27	2012-05-04	The Avengers	225.0	623.279547	1517.935897	1292.935
260	61	2011-07-15	Harry Potter and the Deathly Hallows: Part II	125.0	381.193157	1341.693157	1216.693
41	42	2018-02-16	Black Panther	200.0	700.059566	1348.258224	1148.258
112	13	2018-06-22	Jurassic World: Fallen Kingdom	170.0	417.719760	1305.772799	1135.772

So let's make another column 'dom_net', the domestic net profit:

In [18]: budgets['dom_net']=budgets['domestic_gross'] - budgets['production_budget']

In [19]: budgets_dn=budgets.sort_values(by=['dom_net'],ascending=False)
budgets_dn.head(10)

Out[19]:

	692	93	2004-05-19	Shrek 2	70.0	441.226247	937.008132	867.0

Let's do some work on the 'gross' dataframe. Basically what was done to the budgets dataframe. First, we'll see what it looks like:

In [20]: gross.info()

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3387 entries, 0 to 3386
Data columns (total 5 columns):
title           3387 non-null object
studio          3382 non-null object
domestic_gross   3359 non-null float64
foreign_gross    2037 non-null object
year            3387 non-null int64
dtypes: float64(1), int64(1), object(3)
memory usage: 132.4+ KB
```

So the only issue is that the foreign gross isn't a number. Let's fix that:

```
In [21]: gross['foreign_gross'] = gross['foreign_gross'].replace('[\,,]', '', regex=True)
gross.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 3387 entries, 0 to 3386
Data columns (total 5 columns):
title            3387 non-null object
studio           3382 non-null object
domestic_gross   3359 non-null float64
foreign_gross    2037 non-null float64
year             3387 non-null int64
dtypes: float64(2), int64(1), object(2)
memory usage: 132.4+ KB
```

Now to see some sorted values:

```
In [22]: gross.sort_values(by=['domestic_gross'], ascending=False).head(10)
```

Out[22]:

The problem here is that these numbers don't match. Titanic and Avatar are no where to be seen. So I don't think I'll be using this dataset.

In [24]: `gross['foreign_gross'] = gross['foreign_gross'].replace(',', '')

Getting back to the budgets dataframe. Let's start making some visualizations. How about a nice graph of the top 10 highest grossing movies? I'll start by making a new dataframe of just the top 10 highest grossing (using worldwide gross)movies.

First visualization:

```
In [33]: budgets_top=budgets.sort_values(by=['worldwide_gross'],ascending=False).head(10)
```

```
In [35]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="worldwide_gross", y="movie", data=budgets_top, color='blue')
#ax.set_xticklabels(ax.get_xticklabels(),rotation=90)
plt.xlabel("Worldwide Gross(in millions USD)")
plt.title("Top 10 Highest Grossing Movies Worldwide")
plt.ylabel(" ")
```

Out[35]: Text(0, 0.5, ' ')

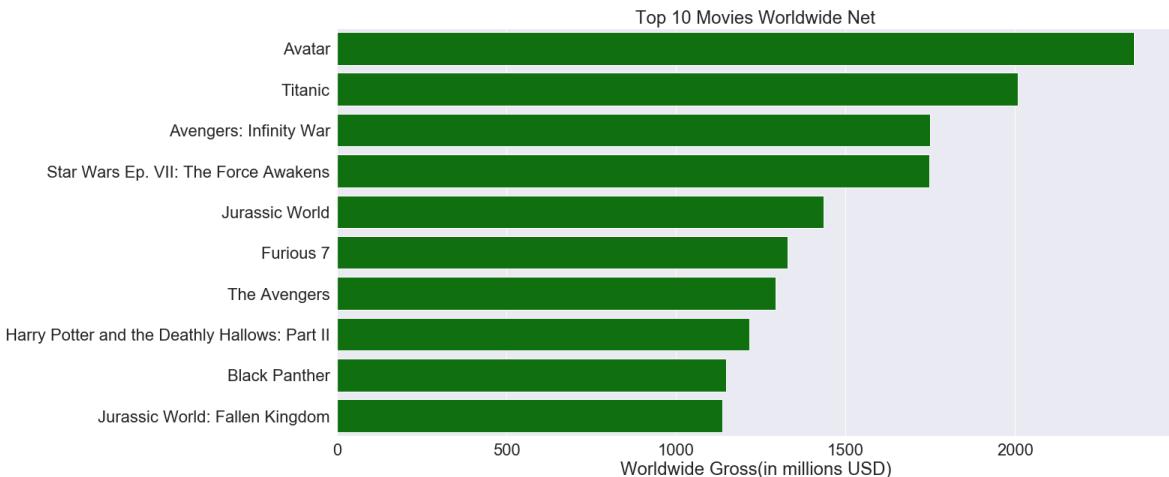

I'm no expert or anything, but that's a nice looking graph. So let's do the same thing, but with worldwide net.

```
In [36]: budgets_top_net=budgets_wn.sort_values(by=[ 'world_net'],ascending=False).head(10)
```

```
In [37]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="world_net", y="movie", data=budgets_top_net, color='green')
#ax.set_xticklabels(ax.get_xticklabels(),rotation=90)
plt.xlabel("Worldwide Gross(in millions USD)")
plt.ylabel(" ")
plt.title("Top 10 Movies Worldwide Net")
```

Out[37]: Text(0.5, 1.0, 'Top 10 Movies Worldwide Net')

So there's definitely a trend here: sci-fi fantasy, and sequels. So now let's look at the worst movies in the budget dataframe.

```
In [38]: budgets_net=budgets.sort_values(by=[ 'world_net' ],ascending=False)
```

In [39]: budgets_net.tail(10)

Out[39]:

	id	release_date	movie	production_budget	domestic_gross	worldwide_gross	world_

2	3	2019-06-07	Dark Phoenix	350.0	42.762350	149.762350	-200.2%

So there are a few movies here that have made no money. That can't be right. Army of the Dead hasn't been released yet, Bright is a Netflix original (so it's tough to know how much money it actually made), and a quick google search says that Call of the Wild actually made \$107 million worldwide. So it's clear that for whatever reason, the numbers were not included in the dataframe. So I think it would simply be best for me to remove them entirely.

In [40]: budgets_net=budgets_net[budgets_net.domestic_gross != 0.0]

So let's make another dataframe to graph, just the bottom 10 movies.

In [42]: budgets_bot=budgets_net.tail(10)

```
In [43]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="world_net", y="movie", data=budgets_bot, color='red')
#ax.set_xticklabels(ax.get_xticklabels(),rotation=90)
plt.xlabel("Worldwide Net Loss(in millions USD)")
plt.ylabel(" ")
plt.title("Bottom 10 Movies Worldwide Net")
```

Out[43]: Text(0.5, 1.0, 'Bottom 10 Movies Worldwide Net')

The problem I'm seeing with these files is that they aren't up to date. I think that's why there is the missing data. The other problem is that it's cut off. Take the above graph, that's simply the bottom 10 movies in that dataframe.

While this graph also looks pretty good, I think I'd like it better if it went the other direction. But for now let's get some more data. Let's grab some data from wikipedia's article on the biggest box office bombs.

More (and hopefully better) data....

```
In [3]: resp=requests.get("https://en.wikipedia.org/wiki/List_of_biggest_box-office_bombs")
```

```
In [4]: soup= bsoup(resp.text)
```

```
In [5]: print(soup.prettify())
```

Due to the secrecy surrounding costs and profit margins in the film industry, figures of losses are usually rough estimates at best, and there are often conflicting estimates over how much a film has lost. To accommodate this uncertainty, the losses are presented as ranges where this is the case, and the list is ordered alphabetically in the absence of a definitive order. Some films on this list grossed more than their production budgets yet are still regarded as flops. This can be due to

Hollywood accounting

practices that typically manipulate profits or keep costs secret to avoid profit-sharing agreements,

but it is also possible for films to lose money legitimately even when the theatrical gross exceeds the budget. This is because a distributor does not collect the full gross, and the full cost of a film can substantially exceed its production budget once distribution and marketing is taken into account. For example, tax filings in 2010 for

Cinemark Theatres

show that only 54.5 percent of ticket revenues went to the distributor, with the exhibitor retaining the rest. While the distributor's cut will vary from film to film, a Hollywood studio will typically collect half the gross in the United States and less in other parts of the world. Marketing often represents a substantial share of the overall cost of the picture too: for a film with an average sized budget the promotion and advertising costs are typically half that of the production budget, and in the case of smaller films it is not unusual for the cost of the marketing to be higher than the production budget.

Nice. Except there are 2 problems: first, 2 rows of column headers. Second, several of the entries are a range of numbers. Let's look a little deeper into this and see if we can fix this.

In [10]: `bombs.info()`

                      ('Ref.', ...)],
```

Ok, let's try to fix this. We'll make a list of column names, and look to put them into the dataframe.

In [12]: `names=['title', 'year', 'net_prod_budget', 'WW_Gross', 'Est_loss_nom', 'Est_loss_adj', 'Ref']`

In [13]: `bombs.columns=names`

118 rows × 7 columns

Excellent. So the next problem is that several of these aren't really numbers (well technically none of them are, but we'll get to that) but ranges of numbers. So we need to fix that somehow. One thing's for sure, we don't need that Ref column, so let's drop it.

In [15]: bombs.drop('Ref', axis=1, inplace=True)

In [16]: bombs.head()

Out[16]:

	title	year	net_prod_budget	WW_Gross	Est_loss_nom	Est_loss_adj

4	The Adventures of Rocky & Bullwinkle	2000	\$76–98.6	\$35.1	\$63.5	\$94

Good, now let's try to make these actual numbers instead of objects. I'm hoping it won't interpret the '-' as a minus sign and then subtract those numbers automatically. First off, let's dump the '\$'.

In [17]: `bombs['Est_loss_adj'] = bombs['Est_loss_adj'].replace('[\$,]', '', regex=True)`
Out[17]:

4	The Adventures of Rocky & Bullwinkle	2000	76–98.6	35.1	63.5	94

Ok, so now how to change the range of numbers into actual numbers?

In [20]: `len(bombs['net_prod_budget'][1])`

Out[20]: 7

This tells us we can go through the list, split the object at the '-'. But then we need to change them into floats, then take the mean. So let's break that into simpler steps. Step 1: Split at the '-'

```
In [21]: bombs['net_prod_budget'][0].split('-')
```

```
Out[21]: ['100', '160']
```

Perfect, so now we've created a list with 2 elements. Sort of. Let's really create a list, call it 'rang' because it'll be the range.

```
In [22]: rang=bombs['net_prod_budget'][0].split('-')
```

```
In [23]: rang
```

```
Out[23]: ['100', '160']
```

Sweet. Now we can take those strings, turn them into floats.

```
In [24]: rang=[float(i) for i in rang]  
rang
```

```
Out[24]: [100.0, 160.0]
```

Step 2 complete. Step 3: create a new variable that contains the mean of our list. The mean seems to me to be the best number to use to best represent what the true number would be.

```
In [25]: rang_mean=sum(rang)/len(rang)  
rang_mean
```

```
Out[25]: 130.0
```

Ok, Step 3 done. Now to put it back into the dataframe.

```
In [26]: bombs['net_prod_budget'][0]=rang_mean
```

4	The Adventures of Rocky & Bullwinkle	2000	76–98.6	35.1	63.5	94

Sure we get a warning, but it worked. So now we need to combine all this into a function and run it through every column. But only if the column contains a dash. If it doesn't contain a dash, it just needs to convert the number to a float. Ok, let's take a step back: let's simply write a for loop to go through a particular column. Then we can write a function to go through an entire dataframe.

In [28]: `numb=list(range(1, len(bombs['net_prod_budget'])))`

```
In [29]: for x in numb:
    if '-' not in bombs['net_prod_budget'][x]:
        bombs['net_prod_budget'][x]=float(bombs['net_prod_budget'][x])
    else:
        rangx=bombs['net_prod_budget'][x].split('-')
        rangx=[float(i) for i in rangx]
        rangx_mean=sum(rangx)/len(rangx)
        bombs['net_prod_budget'][x]=rangx_mean

117	Zoom	2006	75.6	12.5	69	88

Ok, so we got one column squared away, sort of. It's still filled with objects, and not numbers. So let's see if we can fix that:

In [33]: `type((bombs['net_prod_budget'][0]))`

Out[33]: `float`

In [34]: `bombs['net_prod_budget']=bombs['net_prod_budget'].astype(float)`

In [35]: `bombs.info()`

```

Est_loss_adj    118 non-null object
dtypes: float64(1), int64(1), object(4)
memory usage: 5.7+ KB
```

Ok, there, one column fixed. Now to do it for the next few columns:

We'll make a function, called 'changeover', that'll take in a single variable (in this case, it'll be the column value) then it'll remove the dash and change it to the mean, if it's a range of values. If not, it'll remove a '+', if none of those are present, it'll just change the number to a float.

In [36]: `def changeover (var1):`

```
if '-' in var1:
    rangx=var1.split('-')
    rangx=[float(i) for i in rangx]
    rangx_mean=sum(rangx)/len(rangx)
    var1=rangx_mean
elif '+' in var1:
    rangx=var1.split('+')
    var1=float(rangx[0])
else:
    var1=float(var1)
return var1
```

In [37]: `bombs['Est_loss_nom'] = bombs['Est_loss_nom'].map(changeover)`

Ok, it's possible that worked. Let's try it again.

It sure did work. So let's run it through the next columns.

THE BIG BRAIN AM WINNING AGAIN!!! I ARE THE GREATEST!!! Sorry, just got a little carried away that that had worked. Now let's try sorting by Est Loss(nominal, I'm not worried about adjusted)

```

I know I said I'm not interested in the adjusted loss, since an adjusted loss doesn't appear on anyone's books, only the actual loss. I just sorted by the adjusted for fun. Ok, so let's make a graph:

```
In [88]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="Est_loss_nom", y="title", data=bombs_nom, color='red')
plt.xlabel("Worldwide Nominal Loss(in millions USD)")
plt.ylabel(" ")
plt.title("10 Biggest Box Office Bombs Worldwide Net(according to Wikipedia)")
```

Out[88]: Text(0.5, 1.0, '10 Biggest Box Office Bombs Worldwide Net(according to Wikipedia)')

More from Wikipedia

I do like this data more than the bottom of the budgets dataframe. Let's get some more data from Wikipedia.

```
In [46]: resp2= requests.get("https://en.wikipedia.org/wiki/List_of_highest-grossing_films")
```

```
In [47]: soup2= bsoup(resp2.text)
```

```
In [48]: tops_table=soup2.find('table', {'class':'wikitable'})
```

In [49]: tops_table

50 movies is a lot to display, I think I'll trim that list down to 15 (I may have to go back and do the same with the bombs dataframe, for consistency).

In [55]: `top_fifteen=tops.head(15)`

So I'm really only interested in the top 10 movies. I'll make a new dataframe, and get rid of the \$ in that. I always like to leave a copy untouched, in case I want to come back to it and do something later.

```
In [56]: top_fifteen[ 'Worldwide gross' ] = top_fifteen[ 'Worldwide gross' ].replace( '[\$]', '', regex=True)
top_fifteen[ 'Worldwide gross' ]= top_fifteen[ 'Worldwide gross' ].astype(float)

So we have 4 visualizations technically. Really only 2 (best and worst movies). Now we need to make some conclusions about this data.

Obviously, the biggest conclusion is that sequels do better. Specifically, sequels in the sci-fi/fantasy genre are the way to go. 11 of the top 15 are sequels (you could make the case for 12, because *The Lion King* is a remake of the animated film, which is sort of a sequel). So let's see if there's anything Microsoft can use to capitalize on this. But first, I want to go back real quick and look at the 15 biggest bombs, to see if any of them are sequels.

So this does help further my point about sequels. Only 2 of the 15 movies are sequels. So now let's move on to Microsoft, and what it already has that can be used as a movie.

Microsoft (and games) data

I wasn't able to find any specific data table anywhere of Microsoft's most profitable franchises, so I compiled my own data. So after scouring the internet, I came across a wikipedia article of the most profitable video game franchises. But since only a few were owned by microsoft, I figured it was easier to just copy the data by hand into a dataframe than to parse all the data and find some suitable entries.

```
In [120]: micro_franchises= {'title': ['Elder Scrolls', 'Halo', 'Gears of War', 'Fallout'],
 'total_copies_sold':[59,70,26,38], 'total_revenue':[3.05,5.0,1.0,1.64]}
```

```
In [121]: micro_fran=pd.DataFrame(micro_franchises,columns=['title','total_copies_sold',
 'total_revenue'])
```

In [122]: micro_fran

Out[122]:

	title	total_copies_sold	total_revenue
0	Elder Scrolls	59	3.05
1	Halo	70	5.00
2	Gears of War	26	1.00
3	Fallout	38	1.64

In [123]: micro_fran['games_in_series']=[5,7,5,6]

In [124]: micro_fran

Out[124]:

	title	total_copies_sold	total_revenue	games_in_series
0	Elder Scrolls	59	3.05	5
1	Halo	70	5.00	7
2	Gears of War	26	1.00	5
3	Fallout	38	1.64	6

In [125]: micro_fran.info()

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 4 entries, 0 to 3
Data columns (total 4 columns):
title           4 non-null object
total_copies_sold 4 non-null int64
total_revenue    4 non-null float64
games_in_series  4 non-null int64
dtypes: float64(1), int64(2), object(1)
memory usage: 256.0+ bytes
```

So I decided to add another column to my dataframe: games in series, because there are a number of games out there and that will clearly affect sales numbers. So let's try to make a stacked graph of some of this data.

```
In [126]: sb.set_style("white")
sb.set_context({"figure.figsize": (24, 10)})
sb.barplot(x = micro_fran.title, y = micro_fran.total_copies_sold, color = "red")
bottom_plot = sb.barplot(x = micro_fran.title, y = micro_fran.games_in_series,
color = "#0000A3")
topbar = plt.Rectangle((0,0),1,1,fc="red", edgecolor = 'none')
bottombar = plt.Rectangle((0,0),1,1,fc='#0000A3', edgecolor = 'none')
l = plt.legend([bottombar, topbar], ['Bottom Bar', 'Top Bar'], loc=1, ncol = 2,
prop={'size':16})
l.draw_frame(False)
```

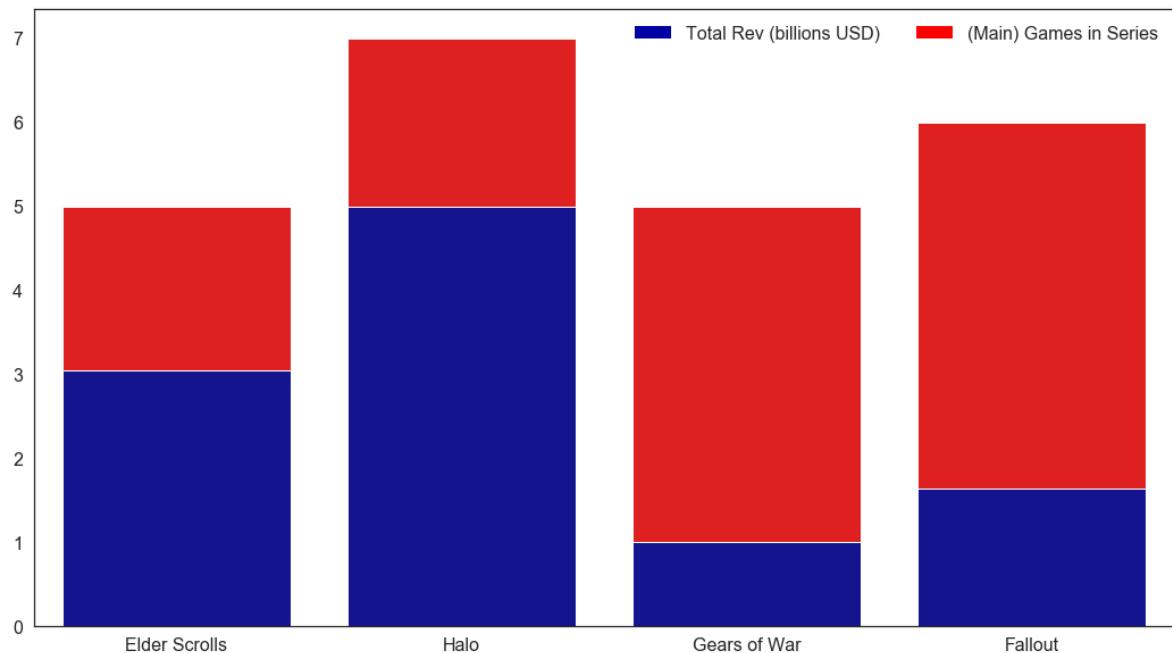

Ok, this looks terrible. So I think I'll use some different columns.

```
In [127]: micro_fran
```

Out[127]:

	title	total_copies_sold	total_revenue	games_in_series
0	Elder Scrolls	59	3.05	5
1	Halo	70	5.00	7
2	Gears of War	26	1.00	5
3	Fallout	38	1.64	6

```
In [128]: sb.set_style("white")
sb.set_context({"figure.figsize": (18, 10)})
sb.barplot(x = micro_fran.title, y = micro_fran.games_in_series, color = "red")
bottom_plot = sb.barplot(x = micro_fran.title, y = micro_fran.total_revenue, color = "#0000A3")
topbar = plt.Rectangle((0,0),1,1,fc="red", edgecolor = 'none')
bottombar = plt.Rectangle((0,0),1,1,fc='#0000A3', edgecolor = 'none')
l = plt.legend([bottombar, topbar], ['Total Rev (billions USD)', '(Main) Games in Series'], loc=1, ncol = 2, prop={'size':16})
l.draw_frame(False)
plt.ylabel(" ")
plt.xlabel(" ")
for item in ([bottom_plot.xaxis.label, bottom_plot.yaxis.label] +
            bottom_plot.get_xticklabels() + bottom_plot.get_yticklabels()):
    item.set_fontsize(16)
```

Much better. So this gives a sense of how profitable these franchises are. So even though Halo sold \$2 Billion more than its closest competitor (Elder Scrolls), that can be attributed to the fact that there are 2 more Halo main games. But it seems like Halo or Elder Scrolls would be the way to go. So now let's just make a simple graph for the copies sold. I went through all the trouble of finding these numbers, no reason to keep them to myself.

```
In [129]: micro_copies=micro_fran.sort_values(by=['total_copies_sold'],ascending=False)
sb.set(font_scale=2)
sb.barplot(x = micro_copies.title, y = micro_copies.total_copies_sold, palette
="Blues_d")
plt.xlabel(" ")
plt.ylabel("Copies Sold (in Millions)")
plt.title("Copies Sold of Microsoft Owned Properties")
plt.show()
```

That's another nice looking graph. So we've established that there are some very profitable Microsoft properties out there. Even changed the color palette just to be different. From what I know of these series, Elder Scrolls and Fallout are more character driven, whereas Halo and Gear of War are more action driven. So that would suggest that Elder Scrolls and Fallout have more in terms of story available. Of course there are also a library of Halo books out there to pick from for a movie. There is also the issue of Elder Scrolls being viewed as too similar to the Netflix series "The Witcher". However that doesn't necessarily mean that an Elder Scrolls movie (or series) would be a failure. Deep Impact came out May 8, 1998, almost 2 months prior to Armageddon (June 30, 1998), but Armageddon did better at the box office (349.5MM vs 553.7MM) although when you consider the budget (75MM vs 140MM), Deep Impact had a better ROI.

Video game movies

So let's shift gears a little, and start looking at video game franchises turned into movies. Again, I decided to manually create a dataframe for this, and then make nice looking graph as well.

```
In [130]: video_game_prop={'title':['Warcraft','Detective Pikachu','Rampage','The Angry Birds Movie','Prince Of Persia: The Sands Of Time','Resident Evil: The Final Chapter','Sonic The Hedgehog','Resident Evil: Afterlife','Lara Croft: Tomb Raider','Tomb Raider'],'year':[2016,2019,2018,2016,2010,2016,2020,2010,2001,2018],'ww_gross':[439,433,428,352,336,314,306,300,274,274]}
```

```
In [131]: vg_fran=pd.DataFrame(video_game_prop,columns=['title','year','ww_gross'])
```

```
In [132]: vg_fran
```

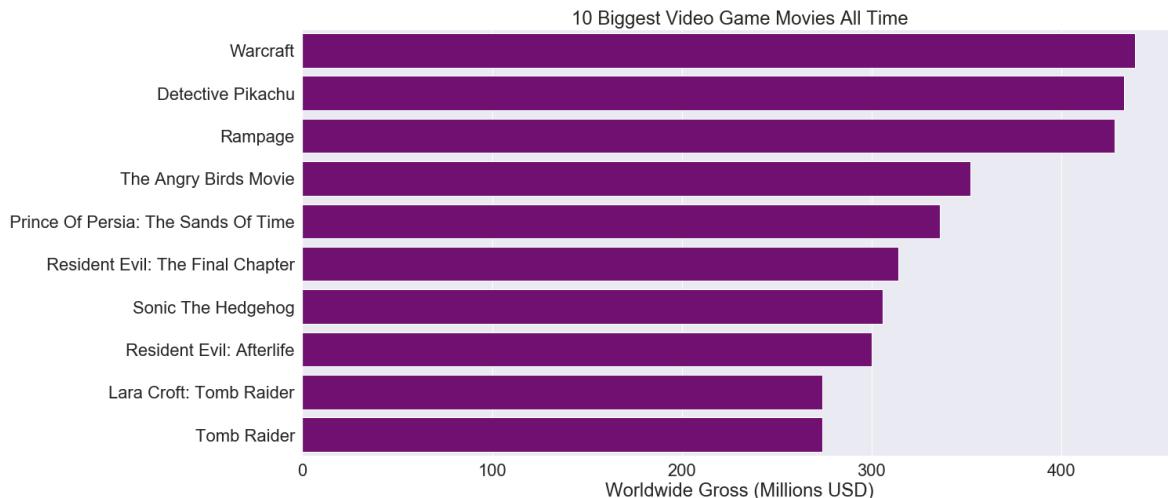

Out[132]:

	title	year	ww_gross
0	Warcraft	2016	439
1	Detective Pikachu	2019	433
2	Rampage	2018	428
3	The Angry Birds Movie	2016	352
4	Prince Of Persia: The Sands Of Time	2010	336
5	Resident Evil: The Final Chapter	2016	314
6	Sonic The Hedgehog	2020	306
7	Resident Evil: Afterlife	2010	300
8	Lara Croft: Tomb Raider	2001	274
9	Tomb Raider	2018	274

I added a column for the year, I'm not sure if that'll be helpful, but because the last 2 movies are both Tomb Raider, I thought it a good idea to have another differentiating factor in there. So let's look at that graph.

```
In [133]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="ww_gross", y="title", data=vg_fran, color='purple')
plt.xlabel("Worldwide Gross (Millions USD)")
plt.ylabel(" ")
plt.title("10 Biggest Video Game Movies All Time")
```

Out[133]: Text(0.5, 1.0, '10 Biggest Video Game Movies All Time')

Ok, so there's evidence here that there is money in video game based movies, really just about any video game. Also, there are 2 Resident Evil movies on the list. That goes to my earlier theory that sequels are the best way to make money in movies. So for a third time, I decided to compile data on Resident Evil movies.

```
In [134]: res_evil_movies={'title':['The Final Chapter','Retribution','Afterlife','Extinction',
                               'Apocalypse','Resident Evil'], 'year':[2017,2012,2010
,2007,2004,2002],
                     'prod_budget':[40.0,65.0,57.5,45.0,50.0,35.0],
                     'ww_gross':[314.1,240.6,295.9,149.9,125.2,103.8]}
```

```
In [135]: re_fran=pd.DataFrame(res_evil_movies,columns=['title','year','prod_budget','ww_gross'])
```

```
In [136]: re_fran
```

Out[136]:

	title	year	prod_budget	ww_gross
0	The Final Chapter	2017	40.0	314.1
1	Retribution	2012	65.0	240.6
2	Afterlife	2010	57.5	295.9
3	Extinction	2007	45.0	149.9
4	Apocalypse	2004	50.0	125.2
5	Resident Evil	2002	35.0	103.8

Ok, so here's another dataframe containing info on the Resident Evil movie franchise. It's certainly the highest grossing franchise based on a video game (live-action), also I do believe it will show a trend that the sequels make more money than the previous movie.

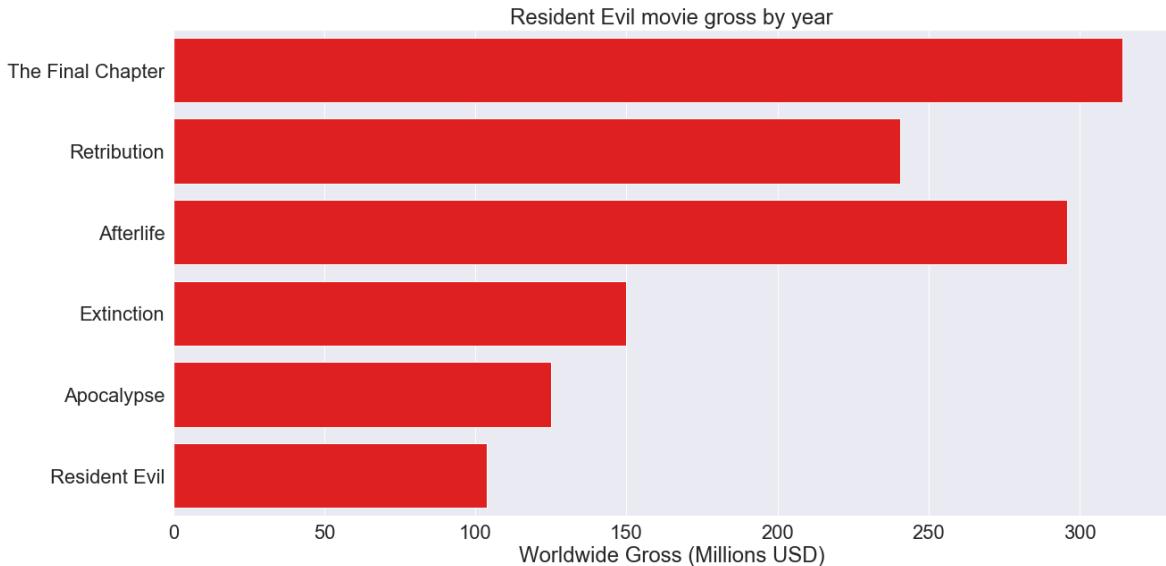

```
In [137]: re_fran_yr=re_fran.sort_values(by=[ 'year' ],ascending=False)
re_fran_yr
```

Out[137]:

	title	year	prod_budget	ww_gross
0	The Final Chapter	2017	40.0	314.1
1	Retribution	2012	65.0	240.6
2	Afterlife	2010	57.5	295.9
3	Extinction	2007	45.0	149.9
4	Apocalypse	2004	50.0	125.2
5	Resident Evil	2002	35.0	103.8

```
In [138]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="ww_gross", y="title", data=re_fran_yr, color='red')
plt.xlabel("Worldwide Gross (Millions USD)")
plt.ylabel(" ")
plt.title("Resident Evil movie gross by year")
```

Out[138]: Text(0.5, 1.0, 'Resident Evil movie gross by year')

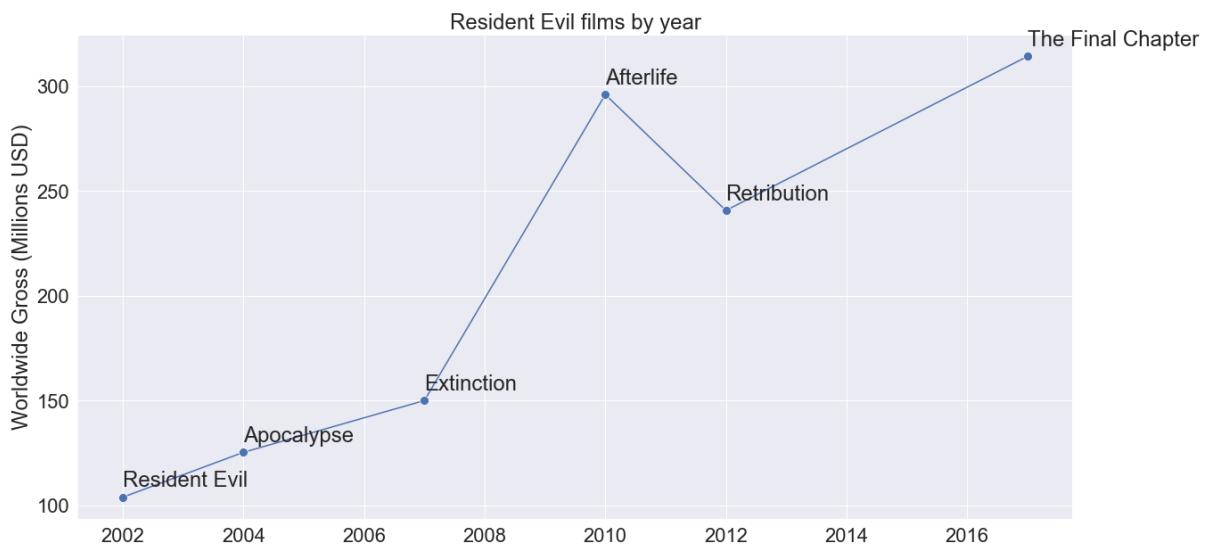

So that's not a bad looking graph, per se. But there is a better way to convey this data. So let's try a line graph.

```
In [142]: plt.figure(figsize=(20,10))
ax1=plt.gca()
sb.lineplot(x="year", y="ww_gross", marker='o', data=re_fran_yr, markersize=10)

for row in re_fran_yr.index:
    name=re_fran_yr['title'][row]
    x=re_fran_yr['year'][row]
    y=re_fran_yr['ww_gross'][row]
    ax1.annotate(name,(x,y+5))

plt.xlabel(" ")
plt.title("Resident Evil films by year")
plt.ylabel("Worldwide Gross (Millions USD)")
plt.show()
```

Aside from 1 outlier, there is a clear trend that the Resident Evil movies made more money with each chapter. In fact, every sequel made more than the original, and 4 out of 5 made more than the previous movie. This further solidifies my argument that sequels are the best way to make money in movies.

Ok, so let's keep working on sequels. Here, I've found a nice wikipedia article on sequels by box office performance. Let's read it and go through the standard formatting.

```
In [143]: resp3= requests.get("https://en.wikipedia.org/wiki/List_of_film_sequels_by_box
-office_performance")
```

```
In [144]: soup3= bsoup(resp3.text)
seqs_table=soup3.find_all('table', {'class':'wikitable'})
```

In [145]: seqs_table[2]

So there's one problem with this, every so often there's a bracketed number appearing. We'll have to get rid of that. However, the first thing we'll do is get rid of the \$.

14	The Lord of the Rings: The Return of the King	2003	1142219401 [51]

So the \$ is gone, now we need to get rid of those bracketed numbers. The easiest way (to me anyway) would be just to overwrite those 2 with new numbers, instead of writing another function or for loop. But this program is about writing code, so let's try it that way. I'll go through the same steps when I was getting rid of the ranges of numbers. So step 1, let's see what it actually looks like.

```
In [155]: seq['Worldwide gross'][7]
```

Out[155]: '1356602810 [50]'

```
In [156]: seq['Worldwide gross'][7].split(' ')
```

Out[156]: ['1356602810', '', '[50]']

Splitting it at the space seems like the smart way to go. So again it creates a list, I can just take the first element of that list, and put that into the dataframe. Seems simple enough.

```
In [157]: bleh=seq['Worldwide gross'][7].split(' ')
```

I ran out of good names for variables.

```
In [158]: bleh[0]
```

```
Out[158]: '1356602810'
```

So now to put it back where we got it in the dataframe. I bet we'll get a warning.

```
In [160]: seq['Worldwide gross'][7]=bleh[0]
```

```

But again, it worked. So I'll write another simple function to take the variable, and if it contains a bracket, it'll split it into a list, then return the first element of the list as a float.

```
In [162]: def change2 (var1):
    if '[' in var1:
        bleh=var1.split(' ')
        numb=bleh[0]
        numbf=float(numb)
    else:
        numbf=float(var1)
    return numbf
```

```
In [163]: seq['Worldwide gross'] = seq['Worldwide gross'].map(change2)
```

```
In [164]: seq.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 30 entries, 0 to 29
Data columns (total 3 columns):
title            30 non-null object
year             30 non-null int64
Worldwide gross  30 non-null float64
dtypes: float64(1), int64(1), object(1)
memory usage: 848.0+ bytes
```

Did anyone else find it weird there weren't any warnings that time?

```
In [165]: seq.head()
```

Out[165]:

	title	year	Worldwide gross
0	Avengers: Endgame	2019	2.797801e+09
1	Star Wars: The Force Awakens	2015	2.068224e+09

3	Jurassic World	2015	1.670401e+09
4	Furious 7	2015	1.518723e+09

Ok, so another successful function and numbers are now numbers. But again, they're pretty big. So let's divide by a million again.

```
In [166]: seq['Worldwide gross'] = seq['Worldwide gross']/1000000
```

In [167]: `seq.head()`

Out[167]:

	title	year	Worldwide gross
0	Avengers: Endgame	2019	2797.800564
1	Star Wars: The Force Awakens	2015	2068.223624
2	Avengers: Infinity War	2018	2048.359754
3	Jurassic World	2015	1670.400637
4	Furious 7	2015	1518.722794

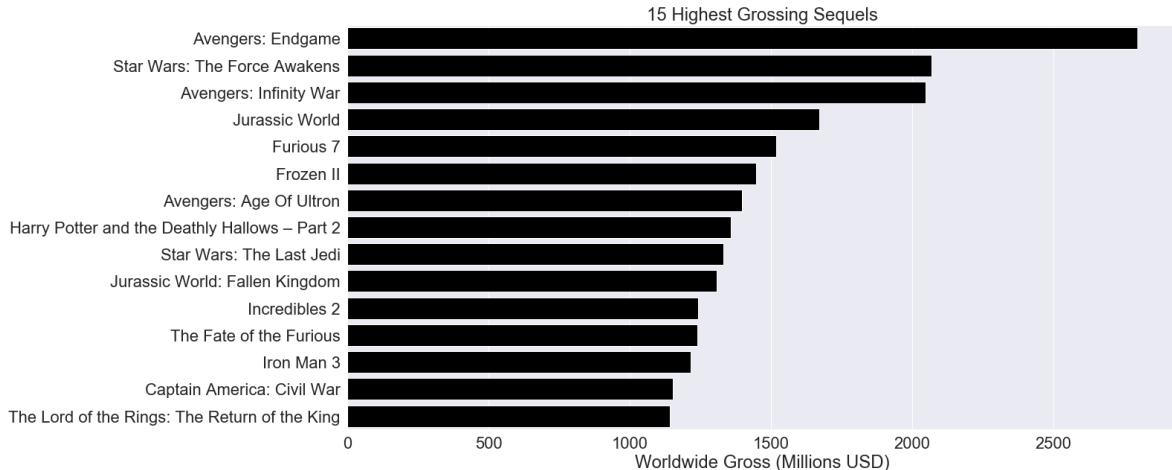

We have another very nice dataframe with pretty manageable numbers. So let's get graphing. First, let's make a new dataframe of just the top ten titles:

In [168]: `seq_tf=seq.head(15)`

In [169]:

```
fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="Worldwide gross", y="title", data=seq_tf, color='black')
plt.xlabel("Worldwide Gross (Millions USD)")
plt.ylabel(" ")
plt.title("15 Highest Grossing Sequels")
```

Out[169]: `Text(0.5, 1.0, '15 Highest Grossing Sequels')`

So not only does this show that sequels are profitable, several of these movies (12 of 15) are not the first sequel, or the second in the series, however you want to look at it. So I think that should be enough data for a minimum viable product. I have several visualizations, and I think I've made a pretty convincing point.

So for some future considerations: I would like to look into how comparably storied movies do against each other (Armageddon vs Deep Impact, White House Down vs Olympas has Fallen, etc.) because I'm concerned that an Elder Scrolls movie, or series, would be seen as too similar to The Witcher. I'd also like to look at how the Star Wars movies have done over time, I'm betting it'll be similar to the Resident Evil graph. Maybe do that for the James Bond movies as well. Then of course there are issues of writers, directors and producers. But so much of that data is skewed by 1 or 2 giant movies, or by having a giant library of films. So a lot of parsing or normalizing of the data would need to happen.

First Revision:

After the initial draft was presented, it was decided more data was needed. Specifically, genre data. So let's find some, and merge it with some of our other data.

So I found a nice website with some movie gross by genre, so let's do some more webscraping:

```
In [65]: resp4=requests.get("https://www.the-numbers.com/market/genres")
```

```
In [66]: soup4= bsoup(resp4.text)
```

```
In [67]: print(soup4.prettify())
```

```

    Our Theatrical Market pages are based on the Domestic Theatrical Market
    performance only. The Domestic Market is defined as the North American movie
    territory (consisting of the United States, Canada, Puerto Rico and Guam).

<p>
```

The yearly amounts on our Theatrical Market pages are based on box office years. Each box office year starts on the first Monday of the year, so the previous year ends on the Sunday before the first Monday. For example, the "2017 box office year" started on January 2, 2017 so the "2016 box office year" ended on Sunday, January 1, 2017.

Ok, so this data is awesomely clean, so I don't think I need to do much here. I can probably do a graph, and get some figures on gross per movie. But I need to merge something with something else. So let's find something.

Well, this one at least has movie titles in it, so that's something. Genre_ids might be useful, but there are several entries per title (I mean, pick a lane, will ya?), so I don't know what I can do with that. Let's look at the net. Wow, so there ARE tables of movies by genre, but they are B-I-G BIG. So good news, most of these movies were released in the last 10 years (stupid Titanic), so maybe I can find a list of movies by genre from 2010-2020. I can't, so it's time to cheat a little: we already know the genres of these movies, right? So let's just import tables of Action, Adventure, Sci-Fi, Romance(might need to check on that).

So I managed to find a number of lists of movies belonging to a particular genre. This is going to be a lot more work than I expected, but c'est la vie.

So this is something. I can make a nice graph of movie gross by genre.

```
In [95]: fig,ax=plt.subplots(figsize=(20,10))
sb.set(font_scale=2)
ax = sb.barplot(x="Gross/Title", y="Genre", data=genre_tops_per, color='blue')
plt.xlabel("Gross per Movie(in millions USD)")
plt.ylabel(" ")
plt.title("Highest Grossing Genres per Movie")
```

Out[95]: Text(0.5, 1.0, 'Highest Grossing Genres per Movie')

I'm getting pretty good at making that particular kind of graph. It might be better as a pie chart. Ok, so let's cheat a little: I can add a genre column to my drama dataframe, and they'll all be 'drama'.

So what I want to do is make a loop (to save typing, I guess) that'll just toss in a column "Genre" and add the value "Drama" to this dataframe.

drama5[ "Genre"] = pd.Series()
while x != len(drama5):
    drama5[ "Genre"] [x] = "Drama"
    x += 1
drama5

So I did manage to get rid of those columns I didn't think I needed, so now I have a drama dataframe I can merge with my top 15.

Getting some BIG datasets

Upon more guidance, I've been advised to look deeper into the IMDB data, to "take a huge dataset and tease out trends". Let's see what we can do.

In [129]: `imdb_rat.info()`

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 73856 entries, 0 to 73855
Data columns (total 3 columns):
tconst          73856 non-null object
averagerating   73856 non-null float64
numvotes        73856 non-null int64
dtypes: float64(1), int64(1), object(1)
memory usage: 1.7+ MB
```

In [130]: `imdb_rat.head()`

Out[130]:

	tconst	averagerating	numvotes
0	tt10356526	8.3	31
1	tt10384606	8.9	559
2	tt1042974	6.4	20
3	tt1043726	4.2	50352
4	tt1060240	6.5	21

In [131]: `imdb_rat_top=imdb_rat.sort_values(by=["averagerating"],ascending=False)`

In [132]: `imdb_rat_top`

Out[132]:

	tconst	averagerating	numvotes
27644	tt8730716	10.0	5
8992	tt1770682	10.0	5
26153	tt2632430	10.0	5
65033	tt9715646	10.0	20
57679	tt5344358	10.0	6
...
50971	tt6017238	1.0	21
32440	tt2087999	1.0	7
36456	tt1896768	1.0	21
54856	tt1976600	1.0	436
39248	tt8654080	1.0	21

73856 rows × 3 columns

What can you tease out from this? I'm stumped. But maybe we can pull something useful out of here. So let's make some criteria for what might be useful. Let's start with number of votes: Less than 10000 and it's gone.

In [134]: `imdb_rat.loc[imdb_rat['numvotes']>10000]`

Out[134]:

	tconst	averagerating	numvotes
3	tt1043726	4.2	50352
16	tt1210166	7.6	326657
17	tt1212419	6.5	87288
19	tt1229238	7.4	428142
20	tt1232829	7.2	477771
...
73543	tt6990206	7.0	32800
73548	tt7008872	7.0	18768
73552	tt7048622	7.7	11168
73600	tt7315484	5.2	22399
73676	tt7772580	6.2	13573

2677 rows × 3 columns

So we have over 2500 results left. From 73000 that's a nice slice. Let's go a bit further: 20000 votes and a rating higher than 7.5.

In [137]: `imdb_rat.loc[(imdb_rat['numvotes'] > 20000) & (imdb_rat['averagerating'] > 7.5)]`

Out[137]:

	tconst	averagerating	numvotes
16	tt1210166	7.6	326657
107	tt1535109	7.8	387402
193	tt1663202	8.0	621193
595	tt8108198	8.5	43409
758	tt1201607	8.1	691835
...
72520	tt6644200	7.6	305031
72557	tt0780504	7.8	521495
72597	tt1899353	7.6	175968
72956	tt2386490	7.6	60769
72973	tt2404461	7.8	41191

278 rows × 3 columns

Much more manageable. Still, I don't like that tconst, so I'm going to do a little more research and see if I can get rid of it. And I did.

Big, BIG Dataset

In [139]: `imdb_aka=pd.read_csv('title.akas.tsv.gz', delimiter = '\t')`

In [140]: `imdb_aka.info()`

Well, they want a big dataset, this is definitely one of them.

In [141]: `imdb_aka.head()`

Out[141]:

Ok, so I think we can trim this down....a lot. First thing's first: region. Let's just assume American films will be in the US region.

In [153]: `imdb_aka.loc[imdb_aka['region']=='US']`

Out[153]:

Not exactly helpful, because I've never heard of any of these movies. So let's look for a movie I know.

In [156]: `imdb_aka.loc[(imdb_aka['title']=='Avengers: Endgame') & (imdb_aka['region']=='US')]`

Out[156]:

	titleId	ordering	title	region	language	types	attributes	isOriginalTitle

15823448	tt4154796	33	Avengers: Endgame	US	en	\N	\N	0

--	--

OKAY! Now we're getting somewhere. So I want to trim this list down to region=US, and language=en, I'll make it its own dataframe.

In [167]: `imdb_US=imdb_aka.loc[(imdb_aka['region']=='US')]`

```
In [157]: imdb_name=imdb_aka.loc[(imdb_aka['region']=='US') & (imdb_aka['language']=='en')]

Much better down to 2149 movies. So I want to merge these dataframes. A small problem, column names 'tconst' and 'titleId', so I'll change that column name in the rating dataframe. But first, let's dump the columns I don't want.

```
In [161]: imdb_name.drop('types',axis=1,inplace=True)
imdb_name.drop('attributes',axis=1,inplace=True)
imdb_name.drop('isOriginalTitle',axis=1,inplace=True)

Ok, so now we have a nice 15 element dataframe. BTW, The Hunt which is rated 6 on this list, made a whopping 15 million, on a budget of 14 million (netting a cool mil). I was told I needed to suss out some data from a large dataset, I took a dataset that was 1.5 GB, and trimmed it down to 15 titles. So I hope I've got enough done to pass this phase. Fingers crossed.
